

1946 PULPWOOD PRODUCTION BY COUNTY IN THE SOUTHEAST

by

James W. Cruikshank, Chief
Division of Forest Economics

SOUTHEASTERN FOREST EXPERIMENT STATION
ASHEVILLE NORTH CAROLINA

I.T. HAIG, Director

PREFACE

Through the McSweeney-McNary Act of 1928, Congress authorized the Secretary of Agriculture to conduct a comprehensive survey of the forest resources of the United States. The Forest Survey was organized by the Forest Service to carry out the provisions of the Act, and each of the 11 Regional Forest Experiment Stations is responsible for the work in its territory. In the Southeastern States the Forest Survey is an activity in the Division of Forest Economics of the Southeastern Forest Experiment Station, Asheville, North Carolina.

The work of the Survey is divided into five major phases:

1. Inventory. Determination of the extent, location, and condition of forest lands, and the quantity, species, and quality of timber on these lands.
2. Growth. Determination of the current rate of timber growth.
3. Drain. Determination of the amount of industrial and domestic wood used, and the total loss resulting from fire, insects, disease, suppression, and other causes.
4. Requirements. Determination of the current and probable future requirements for forest products by all classes of consumers.
5. Policies and plans. Analysis of the relation of these findings to one another and to other economic factors as a basis for public and private policies and plans of forest land use and management.

This progress report summarizes information on the 1946 production of pulpwood obtained in the course of compiling annual forest drain statistics by states and survey units.

1946 PULPWOOD PRODUCTION BY COUNTY

IN THE SOUTHEAST

This statistical release presents data on 1946 pulpwood production by county in Virginia, North Carolina, South Carolina, Georgia, and Florida. It is the second report of this kind published by the Forest Survey at the Southeastern Forest Experiment Station, the first one covering 1945 production in the Carolinas and Virginia.

These data were compiled from information furnished by all the pulp companies located in, or drawing wood from, the five-state territory. All pulpwood produced in the area was included even though some of the wood was shipped to mills outside these five states. Practically all of the individual mills reported production by counties. In a few cases mills reported receipts by shipping points, and production was then assigned to counties on the basis of the counties normally served by these shipping points. Therefore, these data by counties show the approximate production, but totals for groups of counties, survey units, or states should have little error. The maps showing classes of production by counties are believed to be accurate, since the class intervals are broad enough to compensate for errors in the individual county data.

The softwood volume includes all of the southern yellow pines and a small amount of hemlock. The hardwoods are chiefly the blackgums and sweetgum, with some yellow-poplar and soft maple, and smaller quantities of oak. The chestnut includes only the wood used for pulp; additional volumes were produced for use in plants making only tanning extract.

All volumes are based on the 128 cubic-foot standard cord.

In 1946 total pulpwood production in the five states was 4.7 million cords, a 9 percent increase above 1945. Eight percent less wood was produced in Georgia in 1946, but the other four states showed increases as follows: Virginia, 22 percent; South Carolina, 16 percent; Florida, 14 percent, and North Carolina, 10 percent. Only 5 percent more softwood-pulpwood was cut from the forests of the five states, but hardwood production was increased by 67 percent.
